Casebook Ergotherapy in Pediatrics

Oct. 2009, 290 pp., 30 ill., € 29.95, TN 148411, AUS

The textbooks on the different fields of ergotherapy provide surveys of the respective field. The casebooks allow to transfer the theoretical fundamentals to practice. Exemplary cases help students of ergotherapy to specifically prepare for practice. Beginners and experienced therapists can deliberate upon their work in practice. **Being well-prepared for practice:** Transfer of knowledge to practice. Discussion of important problems experienced by the clients. Exercises on systematic procedure, problem analysis, interventional options, and evaluation of results. Suggestions for teachers on how these cases can be applied, carried out and assessed within their lectures.

From the contents: Divided into two parts: **Tasks** and **solutions**. Exemplary cases that describe a clinical problem and set tasks for students, e.g. questions on how to carry out an examination and plan the appropriate therapy. Solutions part with therapies and criteria for evaluation of the therapies.

The new series: Casebooks ergotherapy promote self-organized learning with the help of textbooks. Teachers and students experience a new type of learning: Orientation on practice and daily routine. A Reference Work

Smit et al.: Introduction to Bioregulatory Medicine

July 2009, 180 pp., 80 ill., € 64.95, TN 147611, TPS eigen

After a general introduction to bioregular medicine, the authors describe possible disease developments and introduce practical instruments for the daily practice by means of the Disease Evolution Table (DET). The following two chapters discuss the different preparation groups and the theory and practice of anti-homotoxic treatment. The book closes with a chapter on using anti-homotoxica in combination with complementary therapies, such as neural therapy and electro-acupuncture.

- Homotoxicology, the study of toxins to humans, understands illness as the human body's defense against toxic substances.
- Many human diseases are caused by exposure to toxins, both of external and internal nature. By eliminating toxins in the body, one can restore the body to health. In view of the increasingly polluted environment and damaging lifestyle choices, this is becoming a model more and more noteworthy and significant.
- Homotoxicology is an extension of classic homeopathy. According to this therapeutic model, the type and severity of an illness are determined by the duration and intensity of toxin loading in relationship to the body's inherent capacity for detoxification. The resulting disturbances, which eventually manifest as illness, are the body's attempt to restore a state of biochemical balance. In bioregulatory medicine, helping the body to restore the balance is the ultimate goal of treatment.
